

Test 1.2 - Error #0 Fix

Problem

GetAutoValidationMap had **no error handling**. Any failure in column lookup caused unhandled Error #0.

Solution

Added comprehensive error handling to GetAutoValidationMap:

- Wraps each column read in error check
- Logs which row and column failed
- Skips problematic rows instead of crashing
- Returns partial dictionary even if some rows fail

What to Expect Now

Instead of "Error #0", you'll see specific error messages in Debug window like:

- "Error reading Drop in Column at row 3: <actual error>"
- "Error reading RuleTableName at row 5: <actual error>"

Replace

- AV_Core_v2.1_COMPLETE.bas

Run Test 1.2

vba

TriggerValidation

Watch the ValidationTrackerForm log AND the Immediate Window (Ctrl+G) for specific error details.
