Test 1 Failure - Quick Fix Guide

Issue

ValidateConfiguration returned FALSE

Likely Cause

One of your target sheets doesn't have an Excel Table (ListObject)

Diagnostic Steps

Run This:

```vba
' Import TestModule.bas, then run:
Test1_DetailedDiagnostic
```

This will show you exactly which check failed.

Most Common Issues

1. Target sheet has no Excel Table

Problem: Sheet exists but data isn't formatted as Table
Solution:

1. Go to the target sheet

2. Select your data range

3. Insert → Table (or Ctrl+T)

4. Check "My table has headers"

5. Give table a name (optional)

2. Table name typo in ValidationTargets

Problem: TableName in ValidationTargets doesn't match actual sheet name
Solution: Fix TableName in ValidationTargets table

3. Sheet doesn't exist

Problem: Referenced sheet is missing
Solution: Either create the sheet or disable that target in ValidationTargets

Quick Check

Run these in Immediate Window:

```vba
' Check if Config sheet exists
Debug.Print AV_DataAccess.WorksheetExists("Config")

' Check if your target sheets exist (replace "MySheet" with actual names)
Debug.Print AV_DataAccess.WorksheetExists("MySheet")

' Check if target sheet has tables (replace "MySheet")
Debug.Print ThisWorkbook.Sheets("MySheet").ListObjects.Count
' Should be > 0
```

After Fix

Run Test1_BasicValidation again - should return TRUE
